                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ThrThrSerProLysValGlnArgAlaAspSerAspValIlePheSerAsnSerPheGly 80
                                                                                                                                                                                                                                                                                                                   This is the nucleotide sequence of open reading frame ORF6 of grapevine leafroll virus type 2 (GRBAV-2) RNA (see AAV08874). It codes for a 22 kDa coat protein (see AAV08864-72; for a genome includes 9 open reading frames (see AAV08864-72; for a polyprotein, an RNA-dependent RNA polymerase, heat shock proteins, coat proteins and proteins of unknown function (see AAW13476-84). These can be used to produce antibodies useful for detecting GLRAV in samples e.g. by ELISA (claimed). The nucleic acid molecules can be used to produce probes and primers for such detection, and to transform host cells (especially Agrobacterium vitis, Agrobacterium tumefaciens, grape, citrus, beet or tobacco vitis, Agrobacterium tumefaciens, grape, citrus, beet or tobacco colingart GLRAV-2 resistance to Vitis schon or rootstock cultivars or impart GLRAV-2 resistance to Vitis schon or rootstock cultivars cloimed). Because extensive similarity exists between hspor-relaced sequence regions of GLRAV-2 and other closeroviruses, the ENA may also be used to impart beet yellows vitus resistance to beet cultivars or tristeza vitus resistance to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           21 AsnGlyValAspLysJysLeuLeuSerAlaGluValGluLysMetLeuValGlnLysJly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        type 2 (GLRAV-2) has been sequenced and cloned from GLRAV-2 isolated from infected Vitis vinifera ov. Pinot Noir. About 83% colorated from infected Vitis vinifera ov. Pinot Noir. About 83% cof the total RNA genome was revelaed from 2 different clones. The sequence in the coat protein gene region was determined and confirmed from several overlapping clones. The sequence in the coat protein gene region was determined and corpulation of GLTAV-2 includes 9 open reading frames (see also AAV08864-72) encoding a polyprotein (see AAW71476) having papain-like proteinse, methyltransferase and helicase motifs, an RNA dependent proteins of unknown function (see AAW71476-84). These proteins can be used to produce antibodies, useful to detect GLRAV in samples e.g. by ELISA (claimed). The nucleic acid molecules can be used to produce probes and primers for such detection, and to transform host cells (especially Agrobacterium vitis, Agrobacterium fortuna cells (especially Agrobacterium vitis, Agrobacterium tumefactens, graph cittus, beet or tobacco cells) and produce impart GLRAV-2 resistance to vitis scion or rootstock cultivars or impart GLRAV-2 resistance resinant beet yellows virus resistance to cittus scion children to but way also be used to liminate beet yellows virus resistance to cittus scion colored to but this action or rootstock colored to but the but may also be used to liminate the colored to impart elected to impart sesistance to cittus scion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           41 AlabroAsnGluGlylleGluValValPheGlyLeuLeuLeuTyrAlaLeuAlaArg 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequences given in AAT42975-77 represent cDNA sequences encoding coat proteins from beet yellow virus (BYV) beet western yellow virus (BNYV) and beet necrotic yellow vein virus (BNYVV) respectively. These sequences are used in the recombinant DNA sequence of the invention. This comprises nucleotide sequences encoding the coat proteins of at least one luteovirus and at least one closterovirus. This recombinant DNA may be used to transform sugar beet for combatting viral infection. Other plants may also be transformed e.g. fruit such as mangoes, apples, pears, bananas, and field crops such as sunflower, wheat, barley, maize, and vegetables such as potatoes, carrots, cabbage and onion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recombinant DNA sequence comprising at least two coat protein genes - used to combat viruses in e.g. sugar beet

                                                                                                                                                                                                                                                                                Bax gene. The Bax gene of the invention is useful for identifying Bax-resistant yeast or fungi, identifying, or obtaining and identifying Candida app. sequences that are differentially expressed in a pathway eventually leading to programmed cell death or identifying inhibitors of inhibitor sequences of Bax-induced cell death. The products of the invention have exposeratic, fungicale; immunosuppressive, virucide and vasotropic activity and can be used in vaccines or for gene therapy. The isolated nucleic acids, polypeptides, pharmaceutical compositions,

preparing a medicament for treating, preventing and/or alleviating diseases associated with yeast or fungi or proliferative disorders, such as cancer, or for preventing apoptosis in certain diseases. The compounds or polypeptides, or the genetically modified organism are useful for preparing a medicament for modifying the endogenic flora of humans and other mammals. The vaccine is useful for immunising against yeast or fungal infections. Apoptosis-related diseases include autoimmune disease, its chemia, diseases related with viral infections or neurodegenerations. This sequence represents a polynuchectide associated with the Bax gene described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           137

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to the genomic sequence of Pyrococcus abyss; and P. abyss; proteins (see AAB96637.AAB96842). P. abyssi is a hypothermobhilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is a fragment of the genomic sequence of P. abyss. The 3 rend of this sequence overlaps with the 5 end of AAH41223. The proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to Note: This patent is in the same patent family as WO200065052, which contains additional sequences as shown in AAB99132-AAB99143,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               84
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              --ValvalThrGluGlyAspLeuLysLysValLeuAspGly 97
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LysLeuLeuSerAlaGluValGluLysMetLeuValGlnLysGlyAlaProAsnGluGly

The total plasmid DNA of W1 was co-electroporated with shuttle vector pSA3 into phage-sensitive, plasmid-free L. lactis LM0230. Phage-resistant transformants were isolated and found to contain pSRQ800. The isolated DNA can be used to impart phage resistance to bacteria, esp. L.l., for use in the prodn. of fermented dairy
                                                                                                                                                                                                                                                                                                                                                                                                                                                          AbiE, phage abortive infection protein, phage resistance, pSRQ800, lactic acid bacterium, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Isolated DNA encoding the AbiE protein of Lactococcus - for protecting strains used in production of fermented dairy products

The present invention describes a gene (1) derived from Buchnera sp. containing the DNA (a) or (b), (a) has a fully defined base pair sequence selected from a table of sequences found in the Buchnera sp. genemic DNA of ABA92787 given in the specification or is a DNA selected from complementary DNA sequences, and (b) is a DNA which hybridises with the DNA (a) and encodes a protein. Also described are: (1) a recombinant vector (11) containing (1); (2) a transformant (111) containing (11); (3) a genomic DNA of Buchnera sp. containing the sequence given in ABA92787; (4) a plasmid derived from Buchnera sp. containing DNA (c) or (d), (c) is a DNA containing a fully defined sequence given in ABA92786 or ABB92789 and (d) is a plasmid which hybridises with a DNA; and (5) a method for the preparation of a protein in which (III) is cultured and the expression protein of the objective protein is collected from the cresultant culture. The DNA is useful for developing agricultural chemicals for exterminating cockroaches. The present sequence represents the specifically claimed Buchnera sp. genomic DNA sequence from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   435915 AAAAATCAACGTGGATCATTAAGCATTGATGACGAAGGTACTCCAGGTCAAAGAATAT. 435856

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a grapevine leafroll virus (GLRaV-5) DNA sequence of the invention. The DNA sequence can be used in an expression construct. The construct is useful for providing resistance to GLRaV infection in a recombinant plant cell by transforming the plant cell with it, where transcription of the polynucleotide sequence interferes with normal viral function such as movement, encapsidation or replication of viral RNA. The polynucleotide sequence is expressed as an antisense sequence and encodes a GLRaV coat protein, preferably a defective GLRaV coat protein or a GLRaV HSP70 homologue protein. The GLRaV-5 DNA is useful for the synthesis of GLRaV, as diagnostics and probes, for viral gene mapping and for induced plant disease resistance. It Is also useful to detect and quantitate expression of GLRaV in plant tissue prior to use in vegetative propagation, by detecting the presence of GLRAV RNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 GluArgAsnValValValThrGluGlyAspLeuLysLysValLeuAspGlyCysAlaPro 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              10. This sequence represents DNA encoding a 46.5 kD immunogenic fragment of the protective polypeptide antigen (PPA) of the bacterium Erysipelothrix rhusiopathiae. This bacterium infects livestock, particularly pigs (swine erysipelas), and is also able to cause disease in humans. The recombinantly produced PPA fragment may be used as a subunit vaccine for simulating an immune response in animals against Erysipelothrix rhusiopathiae. As the vaccine can be produced recombinantly, it can be produced on a large scale. The vaccine is suitable for transmucous
                                                                                                                                                                                                                                                                                                                                                                                                                                    60 ArgThrThrSerProLysValGlnArgAlaAspSerAspValIlePheSerAsnSerPhe 79

                                                                                                                                                                                                                                                                                                                                       The invention relates to a 46.5 kD immunogenic fragment (AAB14800) of the protective polypeptide antigen (PPA) of the bacterium Erysipelothrix Thusiopathiae, and to DNA encoding it (AAA72113). This bacterium infects livestock, particularly pigs (swine erysipelas), and is also able to cause disease in humans. The recombinantly produced PPA fragment may be used as a subunit vaccine for stimulating an immune response in animals against Erysipelothrix rhusiopathiae. As the vaccine can be produced recombinantly, it can be produced on a large scale. The vaccine is suitable for transmucous administration. The present sequence represents the coding sequence of DNA encoding the full-length PPA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       80 GlyGluArgAs:NalValValThrGluGiyAspLeuLysLysValLeuAspGlyCysAla 99

The present sequence is that of the Bpa gene of strain Fujisawa of Erysipelothrix rhusiopathiae, the causative agent of erysipelas in animals and erysipeloid in humans. The gene encodes a protective antigen (see AAY95782), termed erysipelas protective antigen (spa AAY95782), termed erysipelas protective antigen (spa AAY95782). The was isolated from a genomic DNA library of strain pujisawa by immunoscreening using E. rhusiopathiae convalescent pag serum. The N-terminal portion of the Bpa protein, was isolated comprising residues 12-195 of the protein, was identified as a vaccine antigen. The N-terminal polypeptide was identified as a vaccine antigen. The N-terminal polypeptide comprises of E. rhusiopathiae, where the immunogenic polypeptides of E. rhusiopathiae, where the immunogenic polypeptides comprises an immuno-protective epitope from the N-terminal region of Epa, especially a turkey or pig, from infecting an animal, especially a turkey or pig, from infection by E. rhusiopathiae involves administering the vaccine, or an expression vector comprising a nucleic acid encoding the N-terminal region or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vaccines for protecting turkeys and pigs against Erysipelothrix rhusiopathiae infections comprising a polypeptide sequence from the N-terminal region of an erysipelas protective antigen -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      952
                                                                                                                                                                                                The invention relates to a 46.5 kD immunogenic fragment (AAB14860) of the protective polypeptide antigen (PPA) of the bacterium Erysipelothrix rhusiopethiae, and to DNA encoding it (AAA72313). This bacterium infects livestock, particularly pigs (whine erysipelas), and is also able to cause disease in humans. The recombinantly produced PPA fragment may be used as a subunit vaccine for stimulating an immune response in animals against Erysipelothrix rhusiopathiae. As the vaccine can be produced recombinantly, it can be produced on a large scale. The vaccine is suitable for transmucous administration. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        60 ArgThrThrSerProLysValGinArgAlaAspSerAspValllePheSerAsnSerPhe

Sequence 13408, Application US/09252991A

Patent No. 6551795
GENERAL INFORMATION:
GENERAL INFORMATION:
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: ARROGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
CURRENT APPLICATION NUMBER: US/09/252,991A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2298

Sequence 13950, Application US/09252991A

Patent No. 6551795

GENERAL INFORMATION:

APPLICANT: March Carl Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REFREENCE: 107196.136

CURRENT APPLICATION NUMBER: US/09/252,991A

CURRENT FILING DATE: 1999-02-18

PR.OR APPLICATION NUMBER: US 60/074,788

PR.OR APPLICATION NUMBER: US 60/094,190

PR.OR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 13950

LENGTH: 2433

Patent No. 6475793

GENERAL INFORMATION:
APPLICANT: Resenthal, Andre
APPLICANT: Freiberg, Christoph
APPLICANT: Broughton, William John
ITILE OF INVENTION: Genomic Sequence of Rhizobium SP. NGR 234 Symbiotic
Patent No. 6475793

ITILE OF INVENTION: Plasmid
File RefereNce: CARPO68
CURRENT FILING DATE: 1999-66-22
FRIOR APPLICATION NUMBER: US/09/214,808A
CURRENT FILING DATE: 1997-07-10
FRIOR FILING DATE: 1997-07-10
FRIOR FILING DATE: 1997-07-10
